

SandPro OMP: Missing Pieces Gap Map

The two unresolved product decisions that matter most before wider rollout.

1. Notification Discipline	2. Progress Meaning
What exists In-app bell, @name mentions, tagged teammates, email plumbing, preferences, and Daily Brief.	What exists Progress bar, manual edit, workflow steps, metrics fields, baseline/current/target, and some rollup plumbing.
Still missing A quiet notification rule set: what deserves a popup, what stays only in-app, what becomes email, and what disappears after first notice.	Still missing A visible rule explaining why an objective is 0%, 40%, or 80%, and who is responsible for updating it.
Why Jake cares If users get too many alerts, they ignore the app. If they miss the right alert, accountability breaks.	Why Jake cares Progress that looks official but has no meaning creates confusion and mistrust.
Decision needed Default rule: direct mentions, blockers, assignments, and due/overdue items notify. General activity stays in the app/Daily Brief.	Decision needed Each objective needs a progress mode: Manual, Workflow-based, Metric-based, or Parent rollup.
Next build Add a transient 'soft alert' layer plus clear @name, @team, and @all behavior with guardrails against noise.	Next build Show the source under every progress bar, e.g. '2 of 5 steps complete' or 'Current value is 60% of target.'

Build order	1. Define rules 2. Show the rule in the UI 3. Test with real Jake/Merci objectives 4. Only then widen rollout
--------------------	---

Plain-English takeaway
The app has pieces of both systems, but the missing work is the rule layer. Jake needs to see that OMP does not just collect activity; it decides what deserves attention and explains how progress is earned.

Prepared as a quick visual planning note for Andrew before the next SandPro OMP build pass.
